NIST TEST SUITE FOR TRUE RANDOMNESS

A Statistical Test Suite for Random and Pseudorandom Number Generators for Cryptographic Applications

NIST TEST SUITE FOR TRUE RANDOMNESS

The NIST Test Suite is a statistical package consisting of 15 tests that were developed to test the randomness of (arbitrarily long) binary sequences produced by either hardware or software based cryptographic random or pseudorandom number generators.

- 1. The Frequency (Monobit) Test,
- 3. The Runs Test
- 5. The Binary Matrix Rank Test,
- 7. The Non-overlapping Template Matching Test,
- 9. Maurer's "Universal Statistical" Test,
- 11. The Serial Test,
- 13. The Cumulative Sums (Cusums) Test,
- 15. The Random Excursions Variant Test.

- 2. Frequency Test within a Block,
- 4. Tests for the Longest-Run-of-Ones in a Block,
 - 6. The Discrete Fourier Transform (Spectral) Test,
 - 8. The Overlapping Template Matching Test,
 - 10. The Linear Complexity Test,
 - 12. The Approximate Entropy Test,
 - 14. The Random Excursions Test

Frequency (Monobit) Test

- The focus of the test is the proportion of zeros and ones for the entire sequence.
- The purpose of this test is to determine whether the number of ones and zeros in a sequence are approximately the same as would be expected for a truly random sequence.
- The test assesses the closeness of the fraction of ones to ½, that is, the number of ones and zeros in a sequence should be about the same

Frequency Test within a Block

- The focus of the test is the proportion of ones within M-bit blocks.
- The purpose of this test is to determine whether the frequency of ones in an M-bit block is approximately M/2, as would be expected under an assumption of randomness
- For block size M=1, this test degenerates to test 1, the Frequency (Monobit) test.

Runs Test

- The focus of this test is the total number of runs in the sequence, where a run is an uninterrupted sequence of identical bits.
- A run of length k consists of exactly k identical bits and is bounded before and after with a bit of the opposite value.
- The purpose of the runs test is to determine whether the number of runs of ones and zeros of various lengths is as expected for a random sequence

Test for the Longest Run of Ones in a Block

- The focus of the test is the longest run of ones within M-bit blocks.
- The purpose of this test is to determine whether the length of the longest run of ones within the tested sequence is consistent with the length of the longest run of ones that would be expected in a random sequence.
- Note that an irregularity in the expected length of the longest run of ones implies that there is also an irregularity in the expected length of the longest run of zeroes.
- Therefore, only a test for ones is necessary

Binary Matrix Rank Test

- The focus of the test is the rank of disjoint sub-matrices of the entire sequence.
- The purpose of this test is to check for linear dependence among fixed length substrings of the original sequence.

Discrete Fourier Transform (Spectral) Test

- The focus of this test is the peak heights in the Discrete Fourier Transform of the sequence.
- The purpose of this test is to detect periodic features (i.e., repetitive patterns that are near each other) in the tested sequence that would indicate a deviation from the assumption of randomness.
- The intention is to detect whether the number of peaks exceeding the 95 % threshold is significantly different than 5 %.

Non-overlapping Template Matching Test

- The focus of this test is the number of occurrences of pre-specified target strings.
- The purpose of this test is to detect generators that produce too many occurrences of a given non-periodic (aperiodic) pattern.
- For this test an m-bit window is used to search for a specific m-bit pattern.
- If the pattern is not found, the window slides one bit position. If the
 pattern is found, the window is reset to the bit after the found pattern,
 and the search resumes.

Overlapping Template Matching Test

- The focus of the Overlapping Template Matching test is the number of occurrences of pre-specified target strings.
- Both this test and the Non-overlapping Template Matching test use an m-bit window to search for a specific m-bit pattern.
- If the pattern is not found, the window slides one bit position.

Maurer's "Universal Statistical" Test

- The focus of this test is the number of bits between matching patterns (a measure that is related to the length of a compressed sequence).
- The purpose of the test is to detect whether or not the sequence can be significantly compressed without loss of information.
- A significantly compressible sequence is considered to be non-random.

Linear Complexity Test

- The focus of this test is the length of a linear feedback shift register (LFSR).
- The purpose of this test is to determine whether or not the sequence is complex enough to be considered random.
- Random sequences are characterized by longer LFSRs.
- An LFSR that is too short implies non-randomness

Serial Test

- The focus of this test is the frequency of all possible overlapping m-bit patterns across the entire sequence.
- The purpose of this test is to determine whether the number of occurrences of the 2ⁿm m-bit overlapping patterns is approximately the same as would be expected for a random sequence.
- Random sequences have uniformity; that is, every m-bit pattern has the same chance of appearing as every other m-bit pattern.

Approximate Entropy Test

- As with the Serial test the focus of this test is the frequency of all possible overlapping m-bit patterns across the entire sequence.
- The purpose of the test is to compare the frequency of overlapping blocks of two consecutive/adjacent lengths (m and m+1) against the expected result for a random sequence.

Cumulative Sums (Cusum) Test

- The focus of this test is the maximal excursion (from zero) of the random walk defined by the cumulative sum of adjusted (-1, +1) digits in the sequence.
- The purpose of the test is to determine whether the cumulative sum of the partial sequences occurring in the tested sequence is too large or too small relative to the expected behavior of that cumulative sum for random sequences.
- This cumulative sum may be considered as a random walk

Random Excursions Test

- The focus of this test is the number of cycles having exactly K visits in a cumulative sum random walk.
- The cumulative sum random walk is derived from partial sums after the (0,1) sequence is transferred to the appropriate (-1, +1) sequence. A cycle of a random walk consists of a sequence of steps of unit length taken at random that begin at and return to the origin.
- The purpose of this test is to determine if the number of visits to a particular state within a cycle deviates from what one would expect for a random sequence.
- This test is actually a series of eight tests, one test and conclusion for each of the states: -4, -3, -2, -1 and +1, +2, +3, +4.

Random Excursions Variant Test

- The focus of this test is the total number of times that a particular state is visited in a cumulative sum random walk.
- The purpose of this test is to detect deviations from the expected number of visits to various states in the random walk.
- This test is actually a series of eighteen tests (and conclusions), one test and conclusion for each of the states: -9, -8, ..., -1 and +1, +2, ..., +9.

EXAMPLE

bsn@ubuntu22:-/Desktop/NIST-Statistical-Test-Suite/sts\$./assess 100000

GENERATOR SELECTION

| [0] | Input | File |
|-----|-------|------|
| | - | |

[1] Linear Congruential

- [2] Quadratic Congruential I [3] Quadratic Congruential II [5] XOR
- [4] Cubic Congruential [6] Modular Exponentiation [8] Micali-Schnorr
- [7] Blum-Blum-Shub [9] G Using SHA-1

Enter Choice: 0

User Prescribed Input File: data/data.pi

STATISTICAL TESTS

| [01] | Frequency | [02] | Block | Frequency |
|------|-----------|------|-------|-----------|
| | | | | |

- [03] Cumulative Sums [04] Runs [05] Longest Run of Ones
- [06] Rank [07] Discrete Fourier Transform [08] Nonperiodic Template Matchings
- [09] Overlapping Template Matchings [10] Universal Statistical [12] Random Excursions [11] Approximate Entropy
- [13] Random Excursions Variant [14] Serial
- [15] Linear Complexity

INSTRUCTIONS

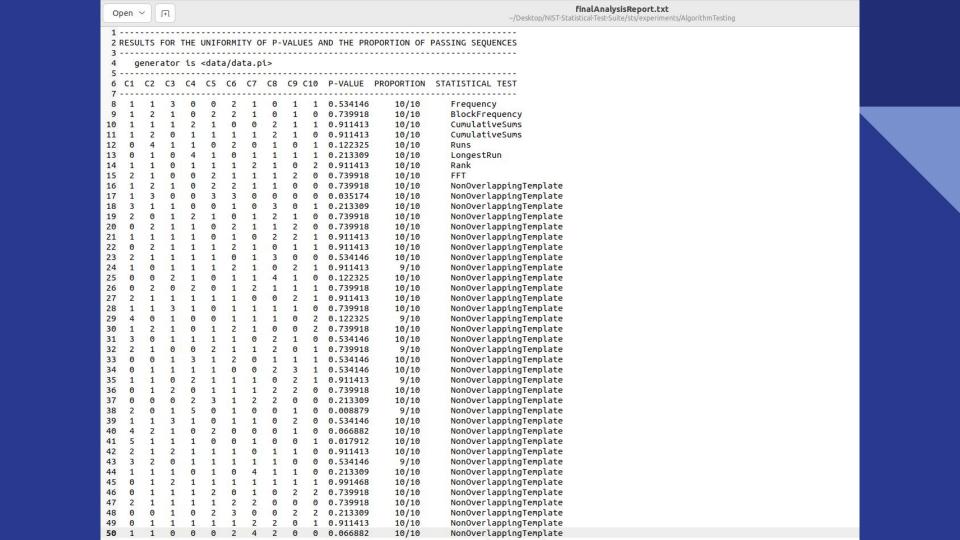

Enter 0 if you DO NOT want to apply all of the statistical tests to each sequence and 1 if you DO.

Enter Choice: 1
